

NME

NERDIO MANAGER FOR ENTERPRISE

The Complete Beginner's Guide

Deploy, manage, and Auto-scale Azure Virtual Desktop and Windows 365 Cloud PC from one console

01 WHAT IS NERDIO MANAGER?

Nerdio Manager for Enterprise (NME) is a deployment, management, and Auto-scaling platform for **Azure Virtual Desktop (AVD)** and **Windows 365 Cloud PC**.

IT teams and system integrators use it to run large desktop estates from a single console, connecting to an environment they already have or configuring a brand-new one.

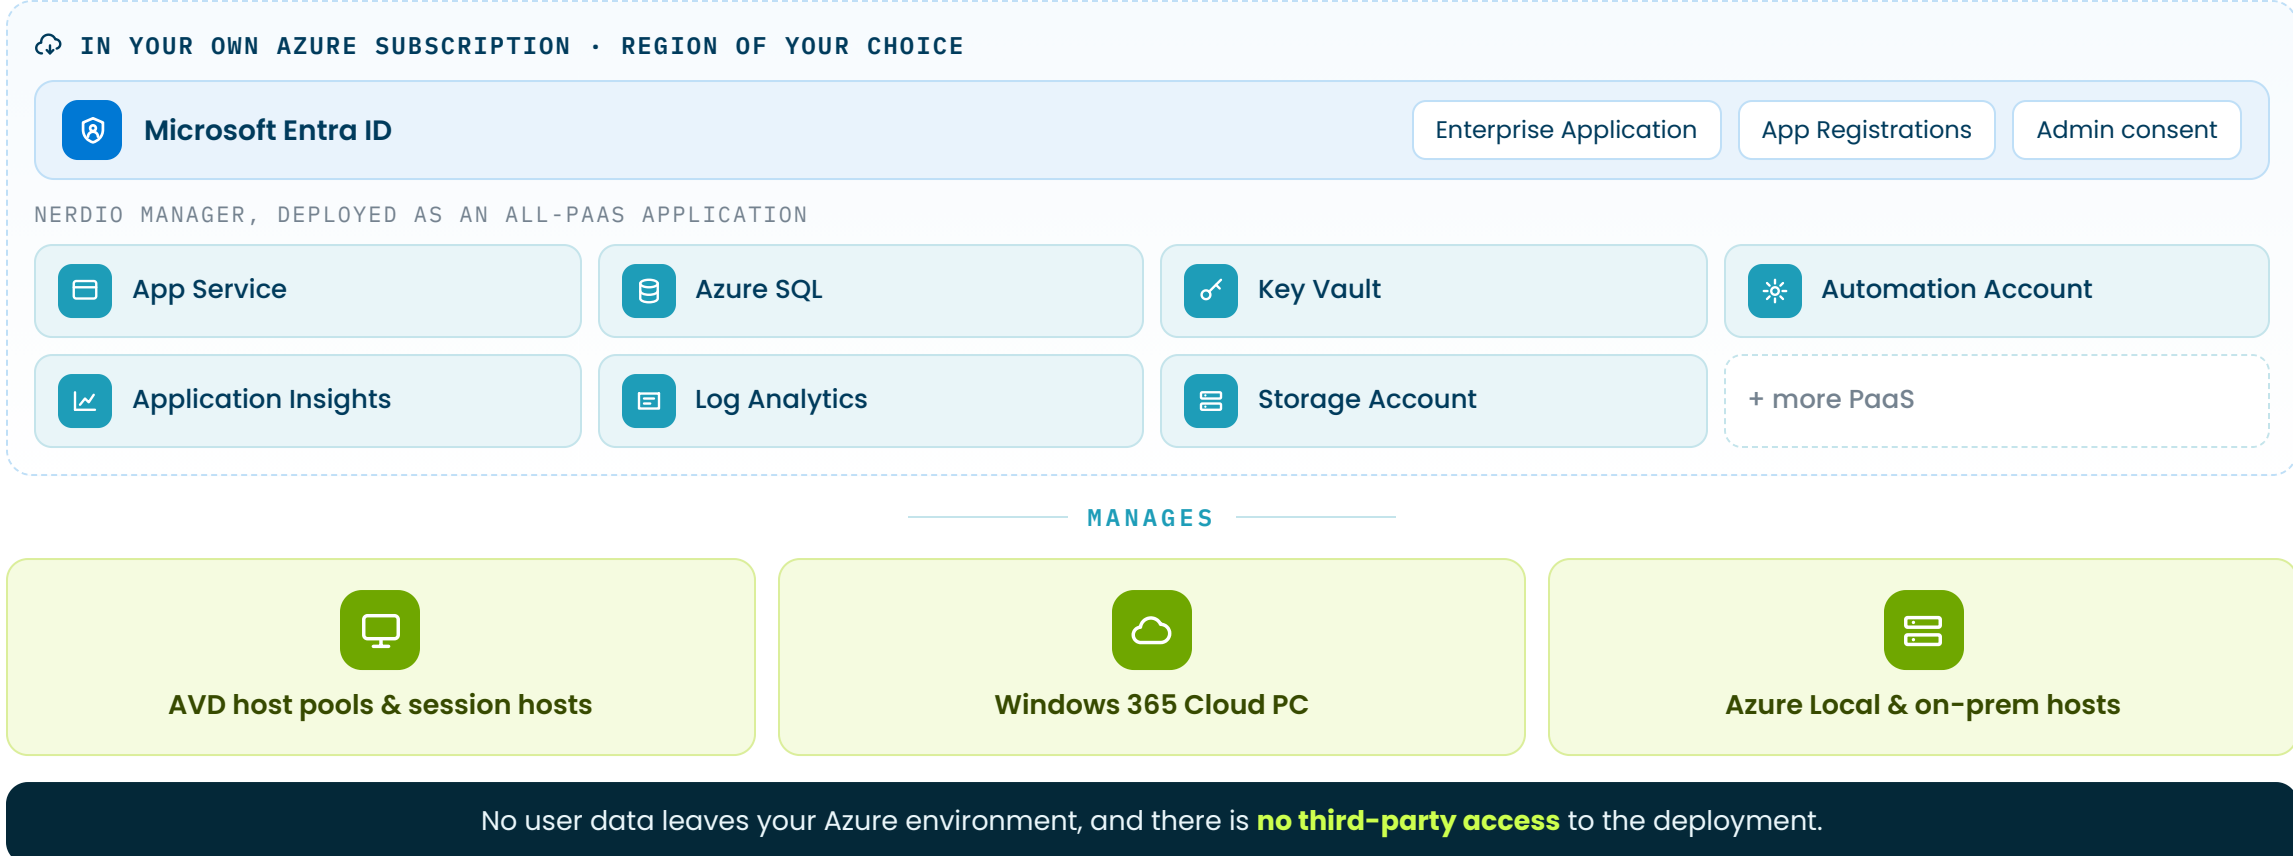

Nerdio serves more than 23,000 customers across 50 countries, from small businesses to large enterprises.

It adds value on top of Microsoft. It does not replace it.

02 WHY ORGANIZATIONS USE IT

- It cuts your Azure bill by scaling session hosts up when demand rises and switching them off when they sit idle.
- It gives you one console for Azure Virtual Desktop, Windows 365, and Intune across the whole desktop estate.
- It automates image builds, patching, and app delivery, so your team stops maintaining fragile scripts by hand.
- It keeps you in control, because the entire platform runs inside your own Azure subscription and Entra ID tenant.
- It lets you delegate day-to-day work safely, using granular role-based access control (RBAC) scoped per team.

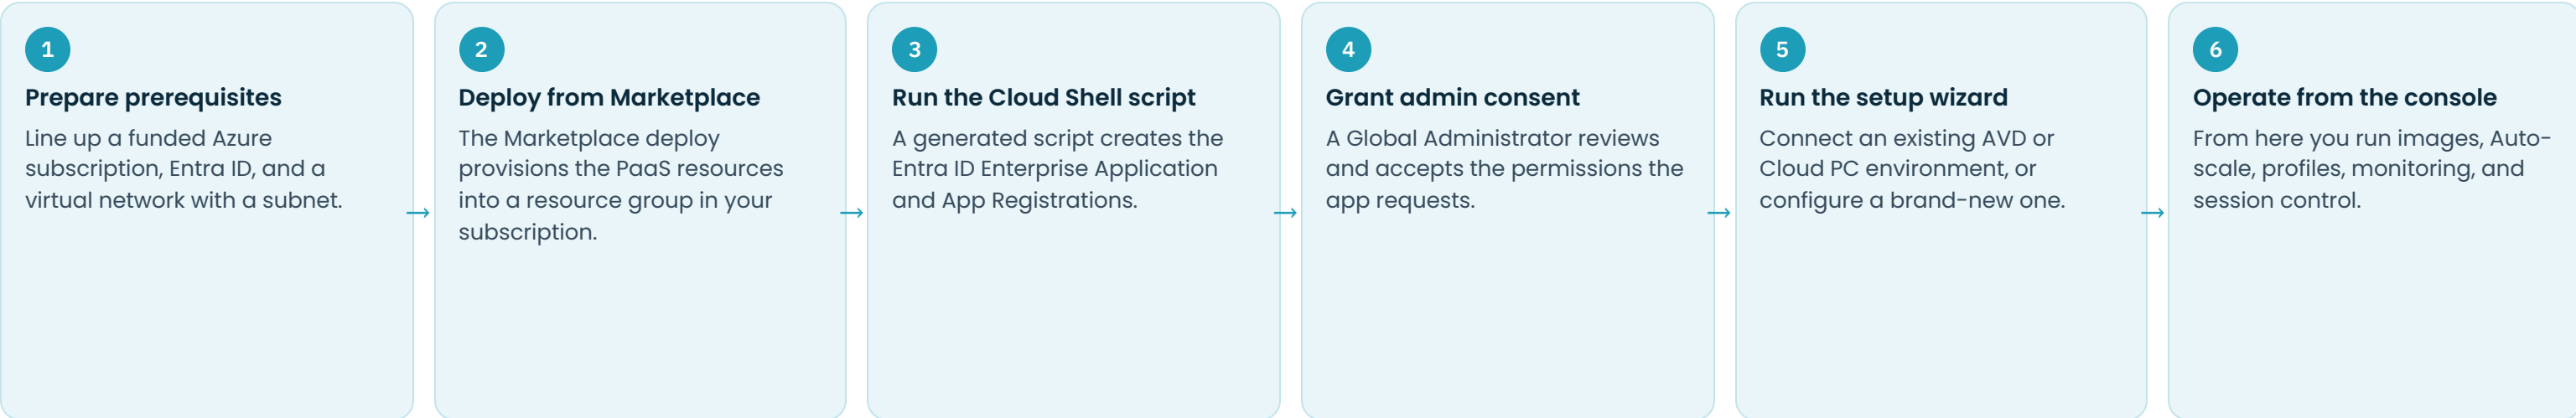

03 ARCHITECTURE: IT RUNS IN YOUR OWN AZURE TENANT

04 WHAT YOU MANAGE FROM ONE CONSOLE

- Host pools and session hosts**, both pooled and personal, are created, scaled, and healed automatically.
- Windows 365 Cloud PCs** are provisioned and managed right beside your AVD estate, from the same console.
- Desktop images and apps** are delivered through one golden image, MSIX App Attach, and app packages.
- FSLogix profiles** live in containers on Azure Files or Azure NetApp Files, set up and managed for you.
- Users, sessions, and costs** sit together in one place, with per-user cost attribution built in.
- Automation** runs through Scripted Actions, triggered on create, on shutdown, or on a set schedule.

05 HOW A DEPLOYMENT WORKS, STEP BY STEP

06 THE WORKLOADS NME ORCHESTRATES

- Azure Virtual Desktop (AVD)** runs as pooled host pools for shared desktops or personal host pools for one-to-one assignment.
- Windows 365 Cloud PCs** are provisioned and managed alongside AVD, so both desktop models live in one console.
- AVD hybrid** extends the same management to session hosts running on Azure Local hardware and on-premises.
- Nutanix AHV** hosts are supported in preview, running on-premises and connected back to Azure through Azure Arc. [Preview](#)
- Microsoft Intune** endpoints, including Cloud PCs and physical devices, are managed with their compliance status in view.

07 AUTO-SCALE

- It grows a host pool automatically when demand rises, then shrinks it back down when the pool sits idle.
- It scales on four live signals: CPU load, RAM usage, active user sessions, and available sessions.
- It scales out the moment any single trigger fires, and scales in only once every trigger is clear.
- It works on both dynamic host pools and personal desktops, each on its own schedule.
- Auto-heal watches for broken session hosts and repairs them automatically, with no manual steps.

08 IMAGE MANAGEMENT

- You maintain one golden image, versioned so you can promote a new build or roll back when needed.
- Patching runs on a schedule you set, timed around Microsoft Patch Tuesday each month.
- Each new image is tested on a staging host pool first, and is activated only once it passes.
- Hosts are re-imaged to the approved version on a schedule, so the whole fleet stays consistent.
- Images can come from the Azure Marketplace, a custom build, or the Azure Compute Gallery.

09 FSLOGIX PROFILES

- It configures and manages your FSLogix profile containers, with no registry hand-editing.
- It automates the profile share end to end: storage account, file share, permissions, and domain join.
- You can apply multiple FSLogix profile configurations, assigning a different one to each host pool.
- Profiles can be deleted, archived, and restored again directly from the User Sessions page.
- Profile storage runs on Azure Files or Azure NetApp Files, whichever fits your performance needs.

10 SECURITY & ACCESS CONTROL

- Admins sign in with Entra ID, so multifactor authentication (MFA) and Conditional Access both apply.
- Access is scoped with granular RBAC roles like AVD Admin, Desktop Admin, and Help Desk.
- You can also build custom roles, granting each team exactly the scope and permissions it needs.
- Traffic is encrypted in transit and at rest, and the management app itself is Veracode verified.
- It is not locked down by default, so run the hardening runbook to add private endpoints.

11 MONITORING & INSIGHTS

- Insights cover Azure Virtual Desktop, Windows 365, and Intune, plus an executive summary view.
- Real-Time Insights show live host health and per-session performance, including user input delay.
- It links your Azure Log Analytics workspaces, so you can query and report on deeper detail.
- Daily cost dashboards break your Azure spend down by category, so nothing hides in the total.
- Intune-enrolled endpoints are listed with their compliance status, right inside the console.

12 COST OPTIMIZATION

- Auto-scale is the single biggest lever, because you pay for session hosts only during the hours they run.
- Storage Auto-scale right-sizes your Azure Files Premium share, so you stop paying for over-provisioned capacity.
- User cost attribution splits the total deployment cost across users, based on how long each one was connected.
- Modeler estimates the monthly per-user cost up front, comparing an optimized deployment against an unoptimized one.
- For steady, predictable workloads, you pair Auto-scale with Azure Reserved Instances to lower the baseline further.

13 LICENSING

- You buy Nerdio Manager through the Azure Marketplace, and it is billed straight to your Azure subscription.
- It comes in two editions, Core and Premium, with the more advanced automation reserved for Premium.
- Pricing is consumption-based, charged per monthly active user rather than per assigned or named user.
- Each user is billed once a month, at the highest entitlement they used: AVD, then Windows 365, then endpoint management.
- A \$1,000 monthly minimum applies, and a fully functional 30-day free trial starts the moment you install.
- You license Microsoft first, for example Microsoft 365 E3 or E5, because Nerdio adds value on top of it.

14 REAL-WORLD EXAMPLE

A company runs **500 knowledge workers** on AVD. Rather than leave every session host on around the clock, NME scales capacity to working hours, keeps one patched golden image, and stores profiles on Azure Files.

80%

UP TO, AZURE*

*Nerdio reports customers save up to 80% on monthly Azure spend. Actual savings depend on workload and usage patterns.

15 QUESTIONS TO TEST YOURSELF

- What is Nerdio Manager for Enterprise, in one sentence?
- Where does NME run, and who owns the data?
- What does Auto-scale do, and what triggers it?
- Which desktop workloads can NME manage?
- How does NME handle golden images and patching?
- What is FSLogix used for, and where do profiles live?
- How is Nerdio Manager licensed and billed?
- Which permissions do you need to install NME?
