

NME

NERDIO MANAGER FOR ENTERPRISE

The Complete Beginner's Guide

Deploy, manage, and Auto-scale Azure Virtual Desktop and Windows 365 Cloud PC from one console

01 WHAT IS NERDIO MANAGER?

Nerdio Manager for Enterprise (NME) is a deployment, management, and Auto-scaling platform for **Azure Virtual Desktop (AVD)** and **Windows 365 Cloud PC**.

IT teams and system integrators use it to run large desktop estates from a single console. It connects to an existing environment or configures a new one.

It adds value on top of Microsoft. It does not replace it.

02 WHY ORGANIZATIONS USE IT

- **Cut Azure cost** by scaling hosts up for demand and off when idle.
- **One console** for AVD, Windows 365, and Intune across the estate.
- **Automate** images, patching, and app delivery instead of scripting by hand.
- **Stay in control:** NME runs in your own Azure tenant.
- **Delegate safely** with granular role-based access control (RBAC).

03 ARCHITECTURE: IT RUNS IN YOUR OWN AZURE TENANT

IDENTITY · MICROSOFT ENTRA ID

Enterprise Application

App Registrations

Admin consent

NME AS AN ALL-PAAS APP · DEPLOYED INTO YOUR OWN AZURE SUBSCRIPTION AND REGION

App Service

Azure SQL

WORKLOADS NME MANAGES

AVD host pools & session hosts

Windows 365 Cloud PC

Azure Local & on-prem hosts

No user data leaves your Azure environment, and there is **no third-party access** to the deployment.

04 WHAT YOU MANAGE FROM ONE CONSOLE

- **Host pools and session hosts**
Pooled and personal AVD, created and scaled in NME.
- **Windows 365 Cloud PCs**
Provision and manage Cloud PCs beside AVD.
- **Desktop images and app delivery**
One golden image, plus MSIX App Attach and app packages.
- **FSLogix profiles and storage**
Profile containers on Azure Files or Azure NetApp Files.
- **Users, sessions, and costs**
Live sessions, RBAC, and per-user cost views.
- **Automation with Scripted Actions**
PowerShell steps on create, shutdown, or a schedule.

05 HOW A DEPLOYMENT WORKS, STEP BY STEP

STEP 1

Prepare prerequisites

A funded Azure subscription, Entra ID, and a virtual network and subnet.

STEP 2

Deploy from Marketplace

Provisions the PaaS resources into a resource group in your subscription.

STEP 3

Run the Cloud Shell script

Creates the Entra ID Enterprise Application and App Registrations.

STEP 4

Grant admin consent

A Global Administrator reviews and accepts the requested permissions.

STEP 5

Run the setup wizard

Connect an existing AVD or Cloud PC environment, or configure a new one.

STEP 6

Operate from the console

Images, Auto-scale, profiles, monitoring, and session control.

06 THE WORKLOADS NME ORCHESTRATES

- **Azure Virtual Desktop (AVD)**
Pooled and personal host pools.
- **Windows 365 Cloud PC**
Provisioned and managed alongside AVD.
- **AVD for Azure Local and on-premises hosts**
Run AVD session hosts on Azure Local hardware (AVD hybrid).
- **Nutanix AHV hybrid hosts** [Preview](#)
Host pools on Nutanix AHV, connected through Azure Arc.
- **Microsoft Intune integration**
Manage enrolled endpoints and see compliance status.

07 AUTO-SCALE

- Grows a host pool for demand, shrinks it when idle.
- Triggers: CPU, RAM, active sessions, available sessions.
- Scale out on any trigger, scale in only when all clear.
- Works on dynamic and personal host pools.
- Auto-heal repairs broken session hosts.

08 IMAGE MANAGEMENT

- One golden image, versioned and staged.
- Automate patching around Patch Tuesday.
- Test on a staging host pool, then activate.
- Re-image hosts to the new version on a schedule.
- Marketplace, custom, and Azure Compute Gallery images.

09 FSLOGIX PROFILES

- Configures and manages FSLogix profile containers.
- Automates the share: storage, permissions, domain join.
- Multiple profile configurations per host pool.
- Delete, archive, and restore profiles from User Sessions.
- Storage on Azure Files or Azure NetApp Files.

10 SECURITY & ACCESS CONTROL

- Sign in with Entra ID; console supports multifactor authentication (MFA) and Conditional Access.
- Granular RBAC: AVD Admin, Desktop Admin, Help Desk, Reviewer, End User, plus custom roles.
- Encrypted in transit and at rest; Veracode verified.
- Not locked down by default: run the hardening runbook for private endpoints.

11 MONITORING & INSIGHTS

- Insights for AVD, Windows 365, Intune, and executives.
- Real-Time Insights: live health and session performance.
- Links Azure Log Analytics workspaces.
- Daily cost dashboards, broken down by category.
- Manage Intune endpoints with compliance status.

12 COST OPTIMIZATION

- Auto-scale is the biggest lever: pay for hosts only when used.
- Storage Auto-scale right-sizes Azure Files Premium.
- User cost attribution splits total spend per user.
- Modeler estimates per-user cost, optimized versus not.
- Pair Auto-scale with Reserved Instances for steady load.

13 LICENSING

- Bought and billed through the Azure Marketplace.
- Two editions: Core and Premium.
- Consumption-based, per monthly active user.
- Billed once a month at the highest entitlement used: AVD, then Windows 365, then endpoint management.
- \$1,000 monthly minimum. 30-day free trial.
- You license Microsoft first (for example, Microsoft 365 E3 or E5).

14 REAL-WORLD EXAMPLE

A company runs **500 knowledge workers** on AVD. Instead of leaving every session host on around the clock, NME auto-scales capacity to working hours, keeps one patched golden image, and stores profiles on Azure Files.

500

USERS

80%

UP TO, AZURE*

*Nerdio reports customers save up to 80% on monthly Azure spend. Actual savings depend on workload and usage patterns.

15 QUESTIONS TO TEST YOURSELF

- 1 What is Nerdio Manager for Enterprise?
- 2 Where does NME run, and who owns the data?
- 3 What does Auto-scale do?
- 4 Which workloads can NME manage?
- 5 How does NME handle golden images?
- 6 What is FSLogix used for?
- 7 How is NME licensed?
- 8 Which permissions install NME?
