

NME

NERDIO MANAGER FOR ENTERPRISE

The Complete Beginner's Guide

Deploy, manage, and Auto-scale Azure Virtual Desktop and Windows 365 Cloud PC from one console

01 WHAT IS NERDIO MANAGER?

Nerdio Manager for Enterprise (NME) is a deployment, management, and Auto-scaling platform for **Azure Virtual Desktop (AVD)** and **Windows 365 Cloud PC**.

IT teams and system integrators use it to run large desktop estates from a single console.

It connects to an environment you already have, or it configures a brand-new one.

It adds value on top of Microsoft. It does not replace it.

02 WHY ORGANIZATIONS USE IT

- It cuts Azure cost by scaling hosts up for demand and switching them off when idle.
- It gives you one console for AVD, Windows 365, and Intune across the whole estate.
- It automates images, patching, and app delivery, so you stop scripting by hand.
- It keeps you in control, because it runs inside your own Azure tenant.
- It lets you delegate safely with granular role-based access control (RBAC).

03 ARCHITECTURE: IT RUNS IN YOUR OWN AZURE TENANT

04 WHAT YOU MANAGE FROM ONE CONSOLE

- Host pools and session hosts**, both pooled and personal, are created and scaled in NME.
- Windows 365 Cloud PCs** are provisioned and managed right beside your AVD estate.
- Desktop images and apps** ship through one golden image, MSIX App Attach, and app packages.
- FSLogix profiles** live in containers on Azure Files or Azure NetApp Files.
- Users, sessions, and costs** sit in one place, with per-user cost views.
- Automation** runs through Scripted Actions on create, shutdown, or a schedule.

05 HOW A DEPLOYMENT WORKS, STEP BY STEP

06 THE WORKLOADS NME ORCHESTRATES

- Azure Virtual Desktop (AVD)** runs as pooled or personal host pools.
- Windows 365 Cloud PCs** are provisioned and managed alongside AVD.
- AVD hybrid** runs session hosts on Azure Local hardware and on-premises.
- Nutanix AHV** hosts are supported in preview, connected through Azure Arc. [Preview](#)
- Microsoft Intune** endpoints are managed with their compliance status in view.

07 AUTO-SCALE

- It grows a host pool when demand rises and shrinks it when the pool sits idle.
- It scales on four signals: CPU, RAM, active sessions, and available sessions.
- It scales out on any single trigger, and scales in only when every trigger is clear.
- It works on both dynamic host pools and personal desktops.
- Auto-heal detects broken session hosts and repairs them automatically.

08 IMAGE MANAGEMENT

- You keep one golden image, versioned so you can roll back when needed.
- Patching runs on a schedule, timed around Patch Tuesday.
- Each new image is tested on a staging host pool before it goes live.
- Hosts are re-imaged to the approved version on a schedule you set.
- Images can come from the Marketplace, a custom build, or the Azure Compute Gallery.

09 FSLOGIX PROFILES

- It configures and manages FSLogix profile containers for you.
- It automates the profile share, including storage, permissions, and domain join.
- You can apply multiple profile configurations, one per host pool.
- Profiles can be deleted, archived, and restored from the User Sessions page.
- Profile storage sits on Azure Files or Azure NetApp Files.

10 SECURITY & ACCESS CONTROL

- Admins sign in with Entra ID, so multifactor authentication (MFA) and Conditional Access apply.
- Access is scoped with granular RBAC roles like AVD Admin, Desktop Admin, and Help Desk.
- You can also build custom roles for the exact scope a team needs.
- Traffic is encrypted in transit and at rest, and the app is Veracode verified.
- It is not locked down by default, so run the hardening runbook to add private endpoints.

11 MONITORING & INSIGHTS

- Insights cover AVD, Windows 365, Intune, and an executive summary view.
- Real-Time Insights show live host health and per-session performance.
- It links your Azure Log Analytics workspaces for deeper reporting.
- Daily cost dashboards break your spend down by category.
- Intune-enrolled endpoints are listed with their compliance status.

12 COST OPTIMIZATION

- Auto-scale is the biggest lever, because you pay for hosts only while they run.
- Storage Auto-scale right-sizes Azure Files Premium so you stop over-provisioning.
- User cost attribution splits the total bill across individual users.
- Modeler estimates per-user cost and compares optimized against unoptimized.
- For steady workloads, pair Auto-scale with Azure Reserved Instances.

13 LICENSING

- You buy and get billed through the Azure Marketplace.
- It comes in two editions, Core and Premium.
- Pricing is consumption-based, per monthly active user.
- Each user is billed once a month, at the highest entitlement they used.
- A \$1,000 monthly minimum applies, and a 30-day free trial is included.
- You license Microsoft first, for example Microsoft 365 E3 or E5.

14 REAL-WORLD EXAMPLE

A company runs **500 knowledge workers** on AVD. Rather than leave every session host on around the clock, NME scales capacity to working hours, keeps one patched golden image, and stores profiles on Azure Files.

500
USERS

24/7
AUTO-SCALED

80%
UP TO, AZURE*

*Nerdio reports customers save up to 80% on monthly Azure spend. Actual savings depend on workload and usage patterns.

15 QUESTIONS TO TEST YOURSELF

- What is Nerdio Manager for Enterprise?
- Where does NME run, and who owns the data?
- What does Auto-scale actually do?
- Which workloads can NME manage?
- How does NME handle golden images?
- What is FSLogix used for?
- How is NME licensed?
- Which permissions install NME?
